Address-Book (Online)

How to run?

- First use the **AddressBook.sql** file to create a database and fill the database with some dummy data. The .sql file already have details of 100 dummy users.

- To create a database use the command in MySQL:

  mysql> source "full path of the file"

  for ex: **mysql> source C:\Users\ABC_PC\Desktop\AddressBook.sql**

  This is the way a sql file can be imported into MySQL, in other databases also it can be done in different ways.

- Import the whole project into eclipse. The project is ready to use after few changes.

- Navigate to project "src" folder, go to Connections package and then open the BookConnection.java file. Make sure that the connection user and password matches your database credentials.

- The application server and database connection need to be configured manually.

- Once everything is set, navigate to WebContent >JSP >LoginPage.jsp – right click > Run As > Run on Server.
